

AI Linc, end to end.

AI Linc is a learning platform for organisations that train people and then help them get hired. It teaches in the learner’s own language, writes its own courses when the one you need does not exist yet, and reshapes each course around the person taking it. What follows is the product as it runs today, screen by screen, in the order a learner meets it.

MASTERY - THIS COURSE

A learner's home: what to do today, how they compare with their cohort, and how ready they are.

START HERE

Three things that make it different

Most learning platforms host content you already have, in one language, the same way for everyone. These three are where AI Linc departs from that, and they are the ones worth understanding before anything else.

MODULE 01

Learn in the language you think in

A live tutor that speaks whatever the learner speaks, and keeps the whole lesson in that language, not just the conversation.

AI TUTOR

Speak Hindi, Tamil or Spanish, and the whole lesson follows

Most “multilingual” tools translate the chat and leave everything around it in English. Here the tutor mirrors the learner’s language in speech. The material it generates afterwards, including the lesson plan, the practice questions and the recap card, is written in that same language. A learner typing an Indian language in English letters is still understood, which is the case most language detection misses.

Mirrors the learner
Speak or type in your language; the tutor answers in it. Nothing to configure.

Romanised script understood
Hindi or Tamil written in English letters is recognised, not treated as English.

Voice or text
Hold a spoken conversation, or type; a session is 10 or 15 minutes.

Not a fixed list
There is no menu of supported languages to pick from. The tutor follows the one the learner actually uses.

A house language, if you want one
Your organisation can pin a default so the first lesson is in the right language before anyone speaks.

Grounded in the course
Suggestions come from what the learner is studying right now, not a generic topic list.

The whole lesson follows
Lesson plan, quiz questions and the end-of-session recap are generated in that language too.

Bilingual is a valid answer
A programme can run in two languages at once rather than forcing one.

Confidence-aware
New to this, some idea, or pretty confident: the explanation is pitched to the answer.

THINGS YOU CAN SAY

Cut in whenever
Interrupt mid-sentence. It stops and deals with what you said.

Ask to be quizzed
Say "quiz me on this" and a question appears for you to answer.

Topics drawn from the learner’s current course, with a confidence setting and session length

If the course does not exist, make it

A plain-English brief becomes a full course, with weeks, topics, articles, quizzes and coding problems, so your catalogue is never the limit.

COURSE BUILDER

“8-week Python for absolute beginners, article + quiz per topic”

That sentence is the input. The builder plans the weeks, writes the articles, sets the quizzes and attaches coding problems, and hands you a draft you can edit before anyone sees it. You are not waiting on a content vendor, and you are not limited to what happens to be in the catalogue.

Describe it in a sentence
A plain-English brief is the whole input. No course outline required.

Build by hand instead
A manual route with no AI, for teams who would rather author it themselves.

Edit anything
Every generated article, quiz and problem stays editable afterwards.

It writes the course
Weeks, topics, articles, quizzes and coding problems, generated together so they match.

Or supply an outline
Bring a plan as a file and let the builder fill in the material.

Counts you can see
Each course shows its weeks, topics, articles, quizzes and coding problems up front.

Draft first, always
Nothing reaches a learner until you publish it. Review and edit in between.

Verified question bank
Practice can be drawn from a checked bank rather than generated on the spot.

A brief at the top, the three ways to build underneath, and the existing courses with their draft or published state

The same course, tuned to each person

A short calibration places the learner, and from then on the course meets them where they are rather than running at one fixed level.

ADAPTIVE PERSONALISATION

Calibration sets the level; the course moves with them

Before the real work starts, a short calibration assessment establishes where the learner actually is. After that the course is not one fixed track: quizzes start at the right difficulty, articles open at the right reading tier, and both move as the learner improves. A learner who is finding it easy is not held back, and one who is struggling is not quietly left behind. They can recalibrate at any time.

Calibration first
A short placement assessment establishes the starting level before the course adapts.

Quizzes start at the right difficulty
Not everyone begins at question one of the easy set.

Articles open at a reading tier
The same topic, explained at the depth that learner needs.

It keeps moving
Difficulty follows measured mastery, not a fixed schedule.

Recalibrate anytime
If someone improves quickly, they can reset the baseline rather than grind.

Visible to the learner
The course states the level it has tuned itself to, so it is not a black box.

Readiness, not just progress
Coverage and performance are scored separately: finishing is not the same as being ready.

Feeds the whole system
The same signal drives the learner's scorecard and your team's risk alerts.

A course, already tuned

"AI has tuned this course to you": the level it placed this learner at, and the option to recalibrate

1 • THE LEARNER

Where a learner begins

The hardest question for someone starting out is not “what is in the catalogue” but “where do I start, and what comes after that”. Roadmaps answer it as a route rather than a list.

ROADMAPS

Three ways to choose a route

A roadmap is a path through several courses, laid out as a flow chart. Each box is a real topic the learner can practise and be scored on, so the map is not decoration. It is the syllabus.

- By role**

Frontend, Backend, Full Stack, Data Analyst, Data Engineer, Data Analytics and AI Engineer.
- By skill**

Java, SQL, Data Structures and Algorithms, Business Intelligence, Web Performance, C and C++.
- By employer**

Routes shaped for a named company: TCS, Infosys, Wipro, Accenture, Capgemini, Cognizant, IBM, LTIMindtree, Tech Mahindra.
- Core path and optional depth**

The flow chart separates what is essential from what is enrichment.
- Every box is practisable**

A step is a verified topic with questions behind it, not a heading.
- Ask for your own**

A learner can describe a route in plain English and have one assembled from the verified bank.
- Numbered stages**

The route is grouped into numbered stages, each holding its own cluster of topics, so progress is countable.
- Scored at every step**

A box is not a heading; it is a topic the learner can practise and be scored on.
- Assembled, not invented**

A requested route is built from the verified question bank rather than generated on the spot.

The box model

Margins that surprise you

Values, units and colour

Flexbox and Grid

Normal flow, before any layout system

Flexbox: the container

Flexbox: sizing the items

Grid: defining the tracks

Grid: placing the items

Choosing a layout system

Forms and typography

Responsive and mobile-first

Role, skill and employer routes

A flow chart: core path, optional depth, and what follows what

2 · THE LEARNER

Inside a course

A course is not a playlist of videos. It is a board of topics, each holding a mix of reading, watching, answering and writing code, and the learner always knows which single thing to do next.

FROM COURSE TO LESSON

Four levels, and never a guess about what is next

The course opens on a board. The board holds topics. A topic breaks into steps. A step is the actual lesson. At every level the learner can see how much is done, how long the rest will take, and what unlocks next.

- The journey board**

Every topic in the course, in order, with what is finished and what is open.
- A topic, broken down**

For example: 8 steps, made up of 1 article, 1 quiz and 6 coding problems, about 107 minutes.
- Articles with a check-in**

Reading is confirmed by a question, so progress means understanding rather than scrolling.
- Video that rewards attention**

Watching earns points, with a bonus for not skipping through.
- Quizzes that adapt**

Difficulty follows what the learner has actually mastered.
- Coding in the browser**

Write, run against tests, and submit without installing anything.
- Time estimates**

Each topic and step carries how long it should take.
- Resume exactly where you stopped**

One button returns to the precise step, from anywhere in the product.
- A stated pass mark**

Each course shows the completion threshold that earns its certificate, so the target is never a guess.

Every topic in the course, in order

Its steps, formats and estimated time

An adaptive article, opened at this learner's tier

3 · THE LEARNER

Practice, and proof it worked

Finishing a course is not evidence. The platform separates what someone has covered from what they can actually do, and turns the second into something they can show an employer.

ASSESSMENTS

Tests with the state made obvious

Five clear states

Available, submitted and under review, completed, or expired. Never a question of whether it went through.

Known before starting

Question count, duration, number of sections and the deadline are shown up front.

Proctored when it matters

Marked as proctored before the learner begins, with a device check first.

Company-shaped papers

Practice papers modelled on named employers' screening tests.

Take-home projects

Longer project work alongside timed papers, marked against a rubric.

Results that explain

A per-attempt breakdown rather than a bare score.

Available, under review, completed and expired

The device check: camera, microphone, connection and fullscreen

THE SCORECARD AND THE LADDER

One report, and a credential worth showing

The scorecard is the honest version of a learner’s standing: not just what they finished, but how accurate they were, where they are weak, and how they compare with their batch. Certificates sit on a points ladder, so a credential means a measured amount of work rather than attendance.

1,500

Learning Foundations

3,000

Learning Achievement

5,000

Learning Excellence

10,000

Skill Readiness

25,000

Skill Proficiency

50,000

Skill Excellence

100,000

Skill Mastery

Twelve sections

Activity, consumption, accuracy trends, skills, weak areas, assessments, interviews, consistency, comparatives, trophies, actions and recommendations.

Points for real work

Video, article check-ins, quizzes, coding, checkpoints, finals and AI interviews each carry their own weight.

Verifiable credential

Each certificate carries a public verification link.

You versus your batch

And versus the top 10%, so a number has context.

Harder work counts more

A difficulty multiplier, so gaming the easy items does not pay.

Exports to PDF

The scorecard leaves as a document a learner can send on.

Named weak areas

Specific topics needing attention, not a low score with no explanation.

Points decay

Weekly windows mean a score reflects current effort, not a burst six months ago.

Achievements and trophies

Milestones are recorded alongside the numbers, so progress is visible before the next rung is reached.

The scorecard

STUDENT

Twelve sections of evidence

The Ladder

STUDENT

Seven rungs, earned on points

How points work

STUDENT

Every activity and what it is worth

4 · THE LEARNER

Getting hired

For most learners the qualification is the means, not the end. Interview practice, a resume that scores itself, and a jobs board that knows what they are actually eligible for all sit inside the same product.

INTERVIEW PRACTICE

A live interviewer, on demand

Start in seconds

Pick a topic and difficulty; the questions are generated immediately.

Spoken, not typed

A real-time voice interview with a device check first.

Four kinds

Mixed, technical, behavioural or system design.

Scored and kept

An average and a best score, with every previous attempt retained.

Three lengths

5, 10 or 15 minutes, so practice fits a gap in the day.

Scheduled rounds too

Formal interviews booked ahead and tied to a course.

Kind, difficulty and length

Quick start, scheduled, and history

RESUME AND JOBS

A resume that scores itself, and roles they can actually get

- Live ATS score**
Recalculates as the learner edits, so the effect of a change is visible immediately.
- Fixable suggestions**
Each one shows the points it would add, with a button to apply it.
- Six structured sections**
Basic information, experience, education, skills, projects and certifications.
- Twelve templates**
From Modern and Minimal to Executive and Technical, exported to PDF in one click.
- AI tailoring**
Rewrites the resume against a target role.
- Eight job filters**
Type, location, experience, skills, employment type, posted, closing and salary.
- Eligibility stated**
Each role says whether the learner qualifies yet, and what is missing if not.
- Apply and track in-app**
Browse, applied and saved, without leaving the platform.

ATS score, fixable suggestions and twelve templates

The full sheet, as it exports to PDF

Filters, eligibility and applications

5 · THE LEARNER

Learning alongside other people

Self-paced does not have to mean alone. Live classes, a forum with its own incentives, and a support queue the learner can actually see the state of.

- Live classes

Scheduled sessions with attendance tracked, plus recordings afterwards.
- A real calendar

A month view filtered by batch and course, which syncs to the learner's own calendar.
- Attendance that counts

Sessions attended, attendance rate and live hours, visible to the learner and to you.
- Five kinds of post

Question, poll, resource, discussion and the lighter ones that keep a forum alive.
- Bounties on hard questions

Points attached to unanswered questions, so they get answered.
- Verified answers

Faculty-marked answers, so the correct one is obvious at a glance.
- Support with a status

Open, in progress, resolved and reopened, so the learner is never left guessing.
- Streaks and standing

A leaderboard and streak history that feed the dashboard.

YOUR TEAM · 01

Running the programme

Everything above is the learner's view. This is yours: who is enrolled, who is slipping, what is being taught, and whether any of it is working. Your administrators sign in to the same application and switch into an admin view.

THE NUMBER MOST PLATFORMS BURY

How many of them actually showed up

The admin dashboard opens on engagement rather than enrolment, because enrolment flatters and engagement does not. From there you can narrow to one course, change the window, and export what you are looking at.

- Active against enrolled

Not a headcount: how many did something in the period, and the change on the one before.
- Activities completed

Volume of real learning events rather than logins.
- Median study time

Per active day, so one heavy user cannot flatter the average.
- Tickets waiting

Support left unanswered past its SLA.
- Six time windows

7, 30, 60 or 90 days, 6 months or 12 months.
- Busiest and quietest day

When your learners actually study, which is rarely when you assume.
- Narrow and export

Filter to a single course, then take the view away as a file.

PEOPLE

Finding the ones who need you

Six risk segments

At risk, inactive 30 days, low completion, high performers, never logged in, never active. One click each.

Filter and search

By enrolled course, status, whether they have a saved resume, or by name.

One learner, one record

Enrolment, activity, job history and course access on a single page.

Cohorts and batches

Group learners, map them to courses, and run them on their own schedule.

Instructors you approve

Applications arrive with a CV and are approved or rejected by you.

WHAT YOU TEACH, AND HOW YOU MEASURE IT

Courses, papers, credentials and hiring

The course builder

The one from the start of this document, in its day-to-day place.

Assessment authoring

Write a paper from a brief, or from a blueprint shaped for a named employer.

Live monitoring

Watch an assessment while it is being taken.

Project library

Take-home projects, auto-graded or marked against a rubric, with a verification queue.

Scorecard configuration

Define the skills and badges that learner performance rolls up into.

Certificates

Ten designs and a seven-rung points ladder you control.

Live sessions

Zoom and Google Meet both integrated, in a list or a calendar.

Interview analytics

Total interviews, unique students, completion rate and average score, cut four ways.

A jobs desk

Publish roles to your learners and track applicants, including externally sourced ones.

Brief, manual or outline

Authoring and company blueprints

Skills and badges

Designs and the points ladder

Zoom and Meet

Roles and applicants

YOUR TEAM · 02

Teaching on it

Instructors get a narrower workspace on purpose. They are assigned specific batches and courses, and every page is scoped to that assignment: their students, their gradebook, their classes. One instructor cannot browse another instructor's learners.

A teaching briefing

Opens on the single cohort most worth attention this week, and why.

Cohort health

Per-batch progress with a needs-work flag and a full report.

Classes and attendance

Schedule sessions and record who came.

Two actions, not a wall

One thing to do this week and one to do today.

Scoped rosters

Only the learners in the batches they teach.

Cohort analytics

Progress distribution across the batches they are responsible for.

Their own numbers

Students, cohorts, average progress and how many are at risk.

Gradebook

Submissions for their batches, with the questions and answer key.

Marking is not editing

Being given a batch to teach does not grant the right to rewrite its paper; you grant that separately.

The teaching briefing

Progress, scores and risk

Scoped to assignment

LAST

Setup and housekeeping

The parts you touch when you start and then mostly leave alone: making the platform look like yours, reaching your learners, and handling the questions they send back.

Your own branded instance

Your logo, your colours, your subdomain, your login page wording. Learners see your brand, not ours.

Email campaigns

Tracked as jobs, with assessment emails kept separate.

Instructor approvals

The queue where teaching staff are let in.

Separate certificate branding

A different mark for emails and certificates where you need one.

Targeted notifications

To one learner, a course, a batch, or everyone, deep-linked to the right page.

Only the modules you want

Each part of the platform can be switched on or off for your organisation, so learners are not shown things you do not run.

Payments

Connect your own payment account if you sell courses directly.

Support queue

Open, in progress and resolved, with a named list of who tickets go to.

ABOUT THIS DOCUMENT

How to read it

Every screen here is the live product, photographed as it loaded. Nothing is a mockup, which is worth saying plainly, and so are the caveats below.

- **This is one organisation's view.** The screens come from a demonstration tenant. Your instance carries your branding and only the modules you choose to run, so your sidebar will not match this one exactly.
- **The data is sample data.** Learners, cohorts and results are seeded for demonstration. The shapes and the behaviour are real; the numbers illustrate rather than report.
- **Personal details are blurred.** Email addresses and phone numbers are masked throughout.
- **Empty is sometimes the honest answer.** Where the demonstration organisation has not used a module, the page is shown as it loads rather than dressed up.
- **Captured, not curated.** No screen here was staged, retouched or rebuilt for the document.

See it for yourself

The fastest way to understand the product is twenty minutes inside it. Sign in as a learner, start a tutor session in your own language, and open a roadmap.

[Open the live demo ↗](#)
